

Slice Groups for Post-Compression Region of Interest Encryption in SVC

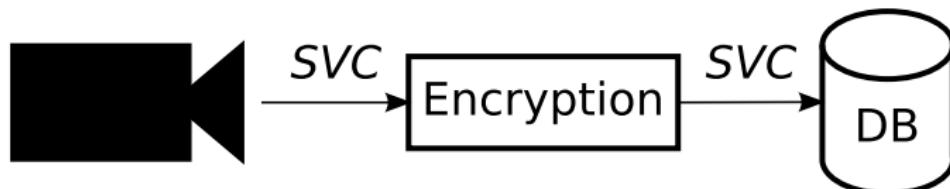

Andreas Unterweger and Andreas Uhl

Department of Computer Sciences
University of Salzburg

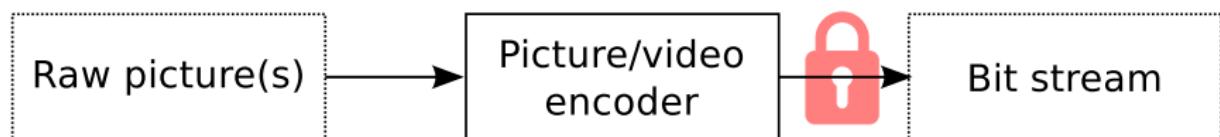

June 11, 2014

Overview

- Use case: Video surveillance
 - Surveillance camera captures images
 - Camera encodes images (SVC)
 - Faces (regions of interest) have to be encrypted before storage
- Scenario: Regions of interest are placed in slice groups
- Questions
 - Does it make encryption easier?
 - What restrictions does it entail?
 - How much more bandwidth does it require?

Post-compression encryption

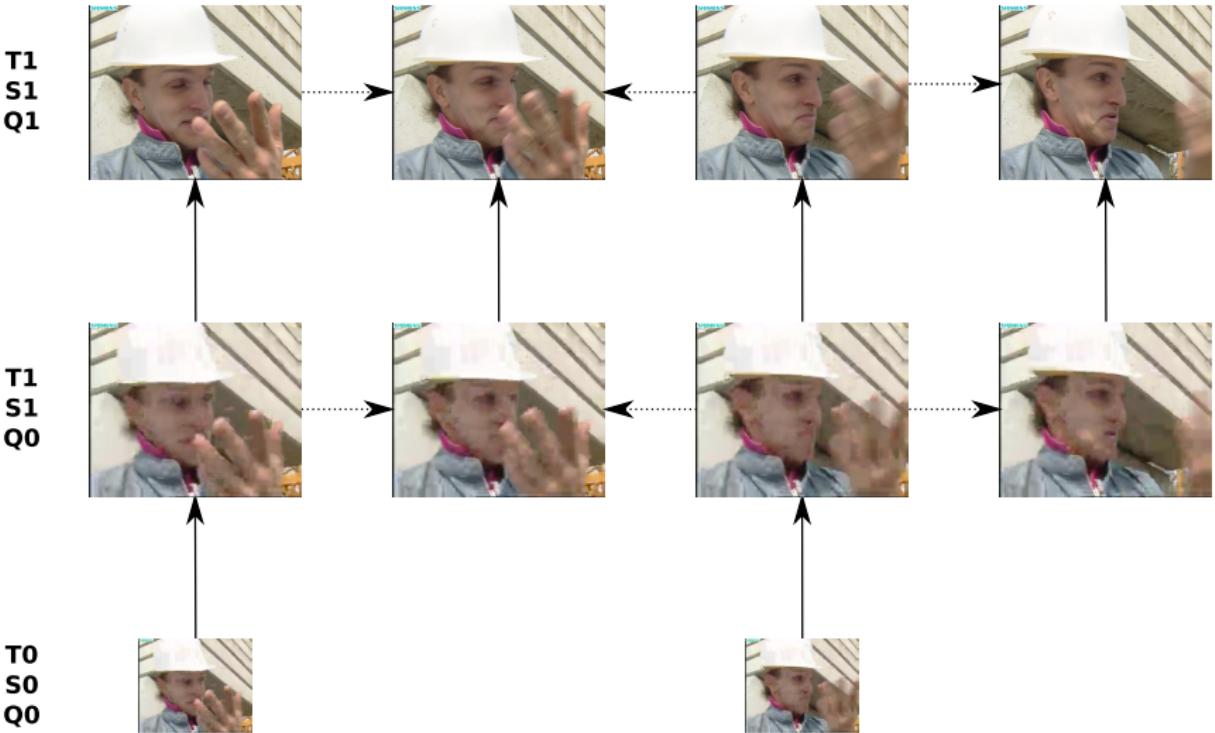

- Encryption after encoding/compression (at bit stream level)
 - Re-encoding not necessarily required → typically fast
- Problem of **drift**

Drift

- Example: IP* GOP structure, eyes in first frame are encrypted
- Spatial vs. temporal drift (depicted: frames 1, 2 and 10)

SVC (Scalable Video Coding)

Slice groups

- Independent groups of macroblocks → contain spatial drift
- Focus: Rectangular slice groups with background (mode 2)

SVC limitations

- Slice groups only supported in Scalable Baseline profile
- Detailed list of limitations (e.g., no B frames) in paper
- No slice groups allowed in base layer → possible workarounds
- Proposed workaround: All-grey base layer

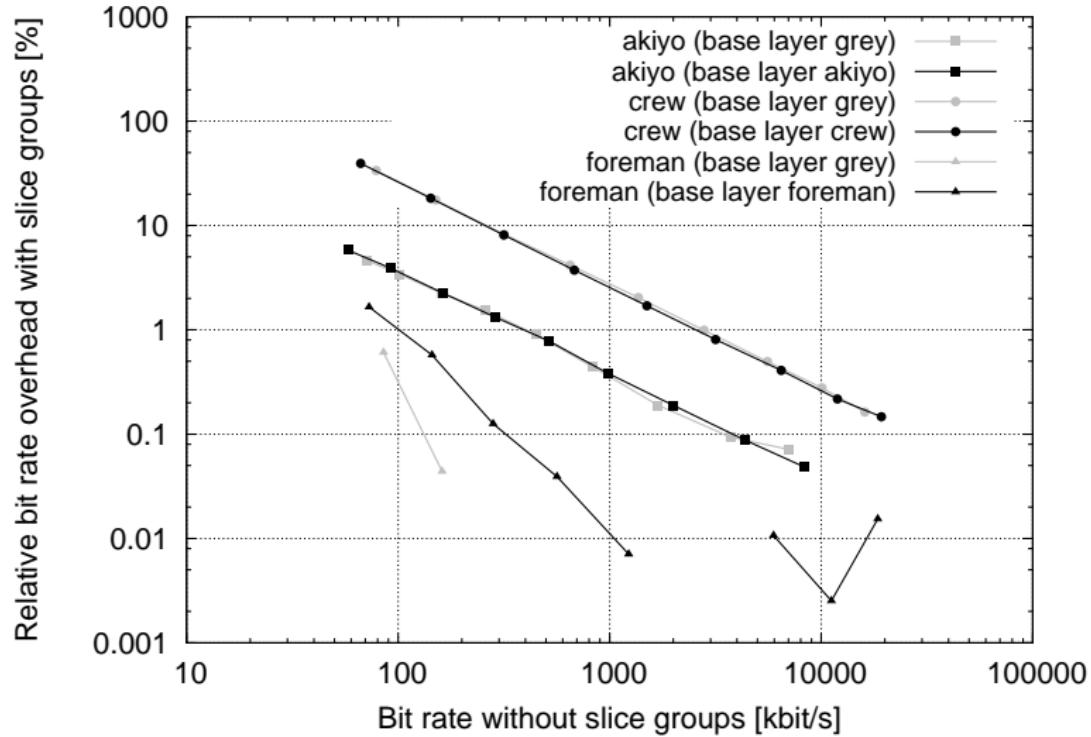

Implementation

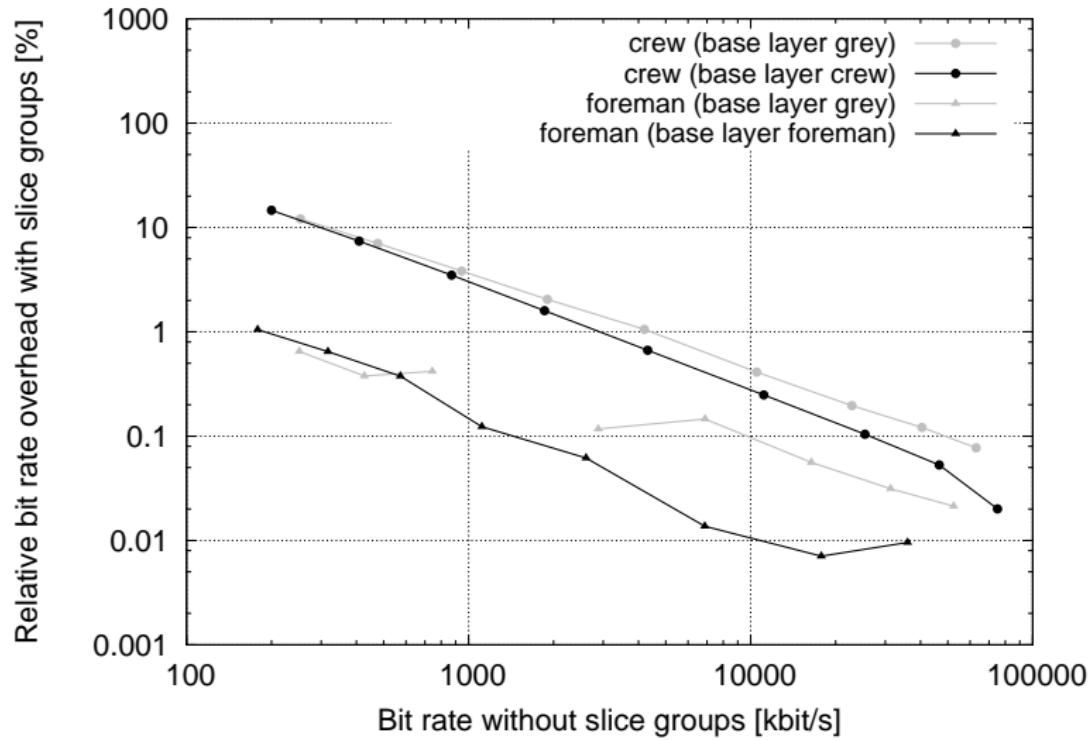

- Moving slice groups (depicted: frames 1, 11 and 21)
 - Slice group count and positions change per frame
- Modification of SVC reference software (JSVM)
- Manual face detection to determine slice group positions
- Setup: Dyadic spatial layers, I(PPP)* GOP structure

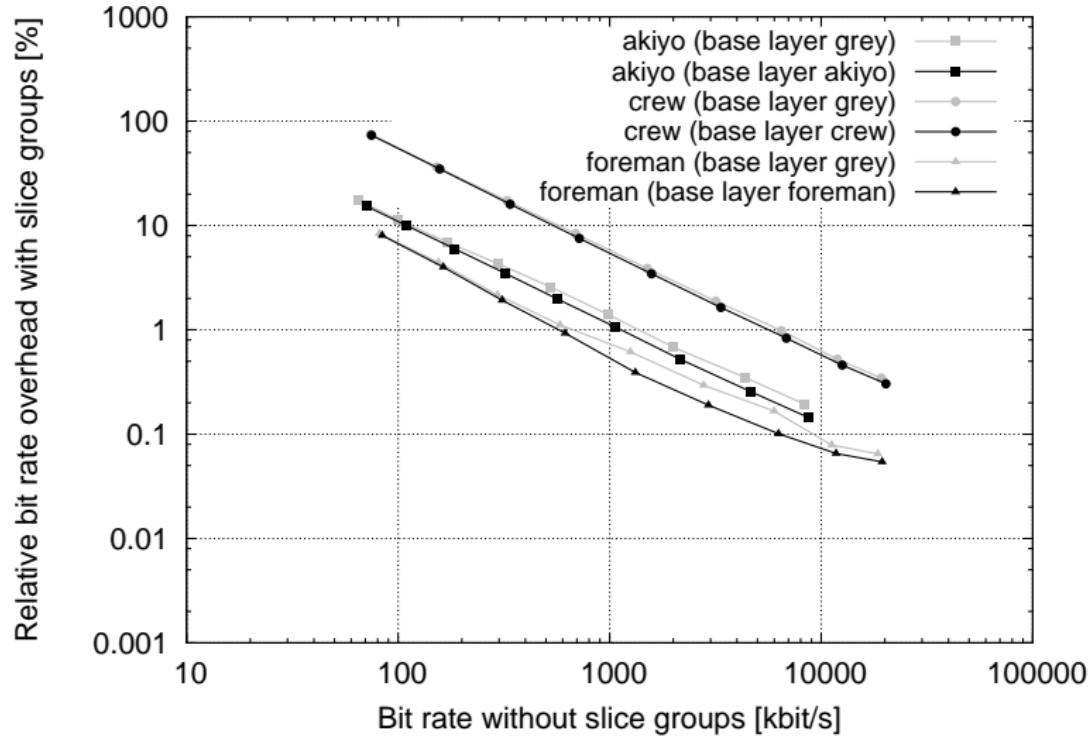

Overhead: Two spatial layers (CIF resolution)

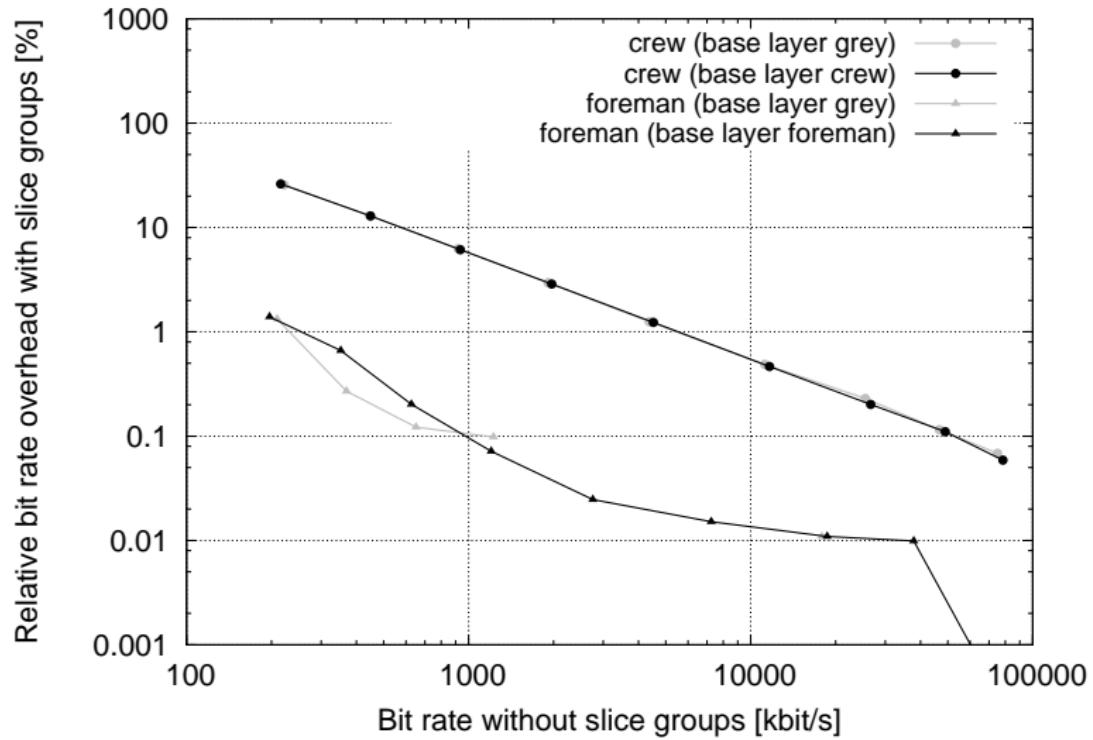

Overhead: Two spatial layers (4CIF resolution)

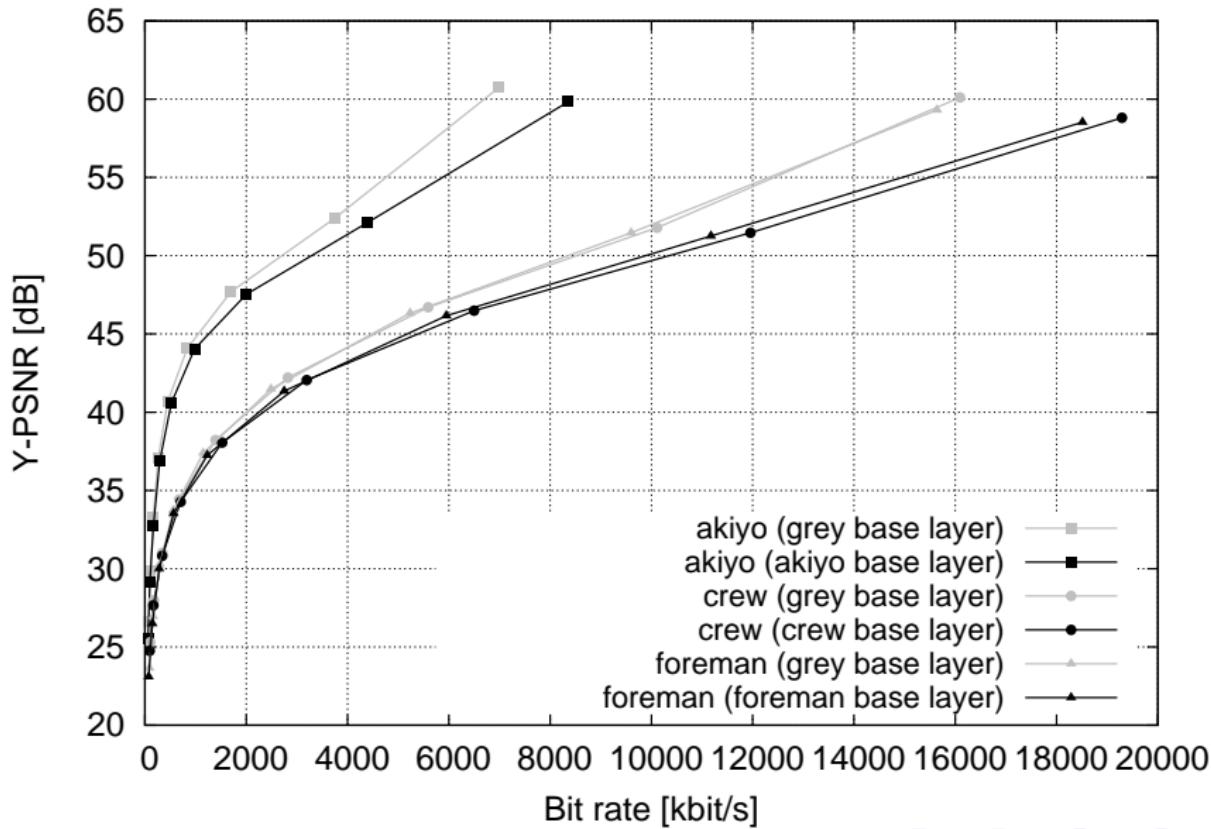

Overhead: Three spatial layers (CIF resolution)

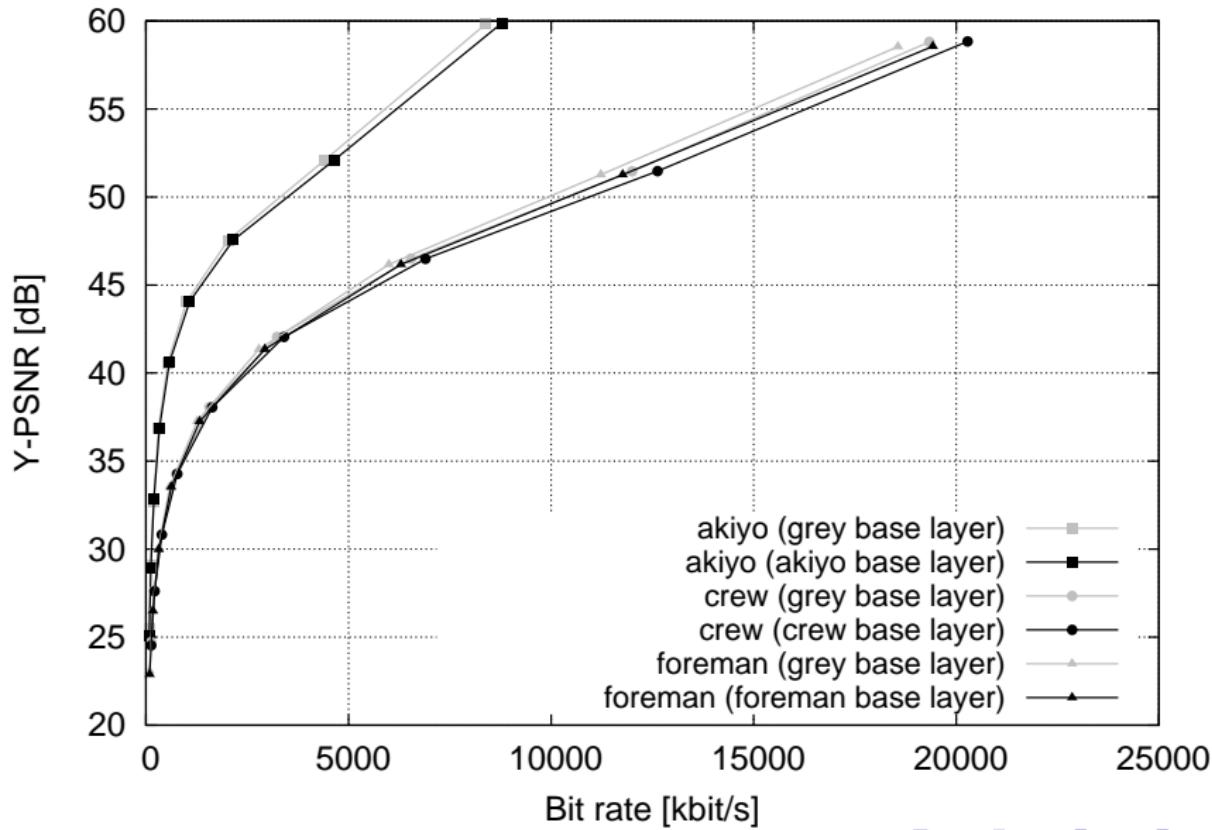

Overhead: Three spatial layers (4CIF resolution)

RD performance: Two spatial layers (CIF resolution)

RD performance: Three spatial layers (CIF resolution)

Conclusion

- Slice groups eliminate spatial drift (temporal drift is still an issue!)
- Simplifies encryption (at the cost of one grey spatial layer)
- Low overhead at medium and high bit rates
- High overhead at low bit rates at CIF resolution
- Moderate overhead at low bit rates at 4CIF resolution
- Overhead decreases with increasing resolution

Thank you for your attention!
